List of all projects that are “active” but and this week’s priority

Table 1: Active Projects

Exp	Experiment
JSRe0002	Chromatin analysis of PRMTi cells: titration of KCl for fractionation validation

Things to discuss today

1. asdf
2. asdf

Overarching Questions

- Following PRMTi, what happens in the cell at early timepoints to alter transcription?

Experiments

JSRe0002-T_Cellular-WB_NB02-153_Chromatin analysis of PRMTi cells: titration of KCl for fractionation validation

Objective

- To validate a fractionation protocol for completing sub-cellular fractionation of cells; define sensitivity to salt (KCl) in nucleoplasm buffer
- Utilize protocol: P_Cellular_Fractionation_20220119_jsr.docx

Status

- Completed trial protocol with test samples

Results

Update this code with the path to your actual files:

JSRe0002; JSRg069a
NB03-021
A549 Fractionation: KCl Titration
4.5e5 A549 cells/condition, 350 uL lysis and extractions

Discussion

- U1-70k, GAPDH, and histones are distributed as expected, validating fractionation
- U1-70k demonstrates KCl-dependent extraction from chromatin; SNRPB high-dose salt is less than expected

Next

- Validated protocol and ready for next exp
- Apply this protocol to PRMT5i-samples to test for altered sub-cellular localization

Table 2: All active projects

Exp	Experiment
-----	------------

Papers to Read

- Genome-wide screen of cell-cycle regulators in normal and tumor cells identifies a differential response to nucleosome depletion

Random Ideas:

- Revisit identification of Rme sites that are involved in ClinVar mutations
